

July Forecast Update for Australian-Region Tropical Storm Activity in 2009/10

Issued: 6th July 2009

by Dr Adam Lea and Professor Mark Saunders
Aon Benfield UCL Hazard Research Centre, UCL (University College London), UK

Forecast Summary

TSR slightly lowers its forecast and anticipates Australian tropical cyclone activity will be about 20% below-norm.

The TSR (Tropical Storm Risk) early July forecast for Australian-region tropical cyclone activity in 2009/10 anticipates activity ~20% below the 1975/6-2008/9 climate norm. The forecast spans the Australian season from the 1st November 2009 to the 30th April 2010 and is based on data available through the end of June 2009. Our main predictor is the forecast anomaly in October-November Niño 4 sea surface temperature (SST) which we anticipate will be warmer than average at $0.66 \pm 0.43^\circ\text{C}$. Since SSTs in this region are linked to vertical wind shear over the Australian region during Austral summer, above-average Niño 4 SST indicates above-average wind shear and below-average tropical storm activity. Thus we expect Australian basin cyclone activity and landfalling numbers to be below-average in 2009/10. Bi-monthly updated forecasts will follow through to early December 2009.

Australian Region Total Numbers Forecast for 2009/10

		Severe Tropical Cyclones	Tropical Storms
TSR Forecast (\pm FE)	2009/10	4.4 (\pm 2.2)	8.2 (\pm 3.1)
33yr Climate Norm (\pm SD)	1975/6-2008/9	5.6 (\pm 2.4)	10.6 (\pm 3.5)
Forecast Skill at this Lead	1975/6-2008/9	10%	24%

Key: Severe Tropical Cyclone = 1 Minute Sustained Wind > 63Kts = Hurricane Category 1 to 5.
 Tropical Storm = 1 Minute Sustained Wind > 33Kts.
 SD = Standard Deviation.
 FE (Forecast Error) = Standard Deviation of Errors in Simulated Real Time Forecasts 1975/6-2008/9.
 Forecast Skill = Percentage Improvement in Mean Square Error Afforded by Cross-Validated Hindcasts 1975/6-2008/9 with 5-year block elimination over Hindcasts Made with the 1975/6-2008/9 Climate Norm.
 Australian Region = Southern Hemisphere 100°E to 170°E (Storm Must Form as a Tropical Cyclone Within to Count).

- Very severe tropical cyclones (hurricane category 3-5) are not forecast due to data reliability problems in the historical record.
- Our Australian-region (100°E to 170°E), while slightly non-standard, is selected to provide the best overview for tropical cyclone activity around the whole of Australia.

There is only a 14% probability that Australian-region tropical storm numbers in 2009/10 will be above average (defined as more than 12 tropical storms), a 32% likelihood they will be near normal (defined as between 9 and 12 tropical storms) and a 54% chance they will be below normal (defined as less than 9 tropical storms). The 1975/6-2008/9 climatology probabilities for each category are 38% (above-normal), 30% (near-normal) and 32% (below-normal).

Australian Landfalling Numbers in 2009/10

		Tropical Storms
TSR Forecast (\pm FE)	2009/10	3.7 (\pm 2.0)
Average (\pm SD)	1975/6-2008/9	4.5 (\pm 2.1)
Forecast Skill at this Lead	1975/6-2008/9	9%

Key: Landfalling Region = Northern Australian coast from Perth around to Brisbane.

- Severe tropical cyclone strikes are not forecast due to their low occurrence rate and to their lack of correlation with tropical storm strike numbers.

There is a 19% probability that Australian tropical storm strike numbers in 2009/10 will be above average (defined as more than 5 landfalling tropical storms), a 36% likelihood they will be near normal (defined as 4 or 5 landfalling tropical storms) and a 45% chance they will be below normal (defined as less than 4 landfalling tropical storms). The 1975/6-2008/9 climatology probabilities for each category are 35% (above-normal), 41% (near-normal) and 24% (below-normal).

Predictors and Key Influences for 2009/10

Our model exploits the predictability of tropical SSTs. Anomalous patterns of SST are the primary source of tropical atmosphere forcing at seasonal and interannual timescales. The predictors in our model for Australian-region tropical storm numbers are:

1. The forecast October-November SST for the El Niño Southern Oscillation (ENSO) Niño 4 region 5°N-5°S, 150°W-160°E. (Main predictor for leads up to November).
2. The observed October-November SST for the Niño 4 region. (Main predictor for December forecast).

Australian-region severe tropical cyclones and landfalling tropical storm numbers are forecast by thinning from the total tropical storm numbers.

The Niño 4 forecast comes from an in-house multi-ensemble extension of the Knaff and Landsea (1997) ENSO-CLIPER model (Lloyd-Hughes et al, 2004).

The key factor behind our forecast for Australian-region tropical storm activity in 2009/10 being below-average is the anticipated suppressing effect of early austral summer SSTs in the Niño 4 region. Warmer than norm SSTs in this region lead to above-average atmospheric vertical wind shear over the Australian region during Austral summer; a condition favouring below-average tropical storm activity. Our current forecast SST anomaly (1975-2008 climatology) for October-November 2009 Niño 4 SST is $0.66\pm 0.43^{\circ}\text{C}$ (up from May's value of $0.19\pm 0.52^{\circ}\text{C}$). The forecast skill for this predictor at this lead is 63% (assessed using cross-validated hindcasts over the period 1975-2008).

Further Information

Further information on the TSR forecast methodology and on TSR in general, may be obtained from the TSR website (<http://tropicalstormrisk.com>). Forecast updates for Australian-region tropical storm activity in 2009/10 will be issued by TSR on the 4th September 2009, 4th November 2009 and 4th December 2009.

Appendix - Predictions from Previous Months

1. Australian Region Total Numbers

a) Deterministic forecasts

Australian Region Total Numbers 2009/10			
		Tropical Storms	Severe Tropical Cyclones
Average Number (\pm SD) (1975/6-2008/9)		10.6 (\pm 3.5)	5.6 (\pm 2.4)
TSR Forecasts (\pm FE)	6 July 2009	8.2 (\pm 3.1)	4.4 (\pm 2.2)
	7 May 2009	9.8 (\pm 3.3)	5.3 (\pm 2.3)

b) Probabilistic forecasts

Australian Region Tropical Storm Numbers 2009/10				
		Tercile Probabilities		
		below normal	normal	above normal
Climatology 1975/6-2008/9		32	30	38
TSR Forecasts	6 July 2009	54	32	14
	7 May 2009	34	35	31

2. Australian Landfalling Numbers

a) Deterministic forecasts

Australian Landfalling Numbers 2009/10		
		Tropical Storms
Average Number (\pm SD) (1975/6-2008/9)		4.5 (\pm 2.1)
TSR Forecasts (\pm FE)	6 July 2009	3.7 (\pm 2.0)
	7 May 2009	4.3 (\pm 2.0)

b) Probabilistic forecasts

Australian Landfalling Numbers 2009/10				
		Tercile Probabilities		
		below normal	normal	above normal
Climatology 1975/6-2008/9		31	44	25
TSR Forecasts	8 July 2008	45	36	19
	7 May 2009	34	38	28
